GALUXIUM NEXUS V2 · HACKATHON SUBMISSION

GigRadar

Find the gigs that fit. Draft the pitch.
You close the deal.

A skill-fit job radar and AI proposal co-pilot for freelancers. A co-pilot, not an auto-apply bot: it prefills, the human presses Submit.

Live app	`https://gig-radar-omega.vercel.app`
Code	`https://github.com/jamesparser/gig-radar`

The problem

Freelancers spend hours a week scrolling listings that don't fit, then rewriting nearly the same proposal.

The common "fix" is auto-apply bots. Marketplaces restrict them, clients ignore the spam they produce, and they put the freelancer's account at risk.

What freelancers actually need

- Know in seconds whether a listing is worth reading, and **why**
- A strong first draft built only from their own real experience
- A short list each morning instead of an endless feed
- To stay in control: their judgement, their voice, their Submit click

The loop

1 · Profile

Skills, niches, rate floor, excluded keywords, portfolio, tone.

2 · Radar

Press *Scan this page* in the extension. Each listing gets a 0–100 fit score with reasons.

3 · Pitch

Pro

Cover letter, three milestones, client questions and a "what you still must do" checklist.

4 · Digest

Pro

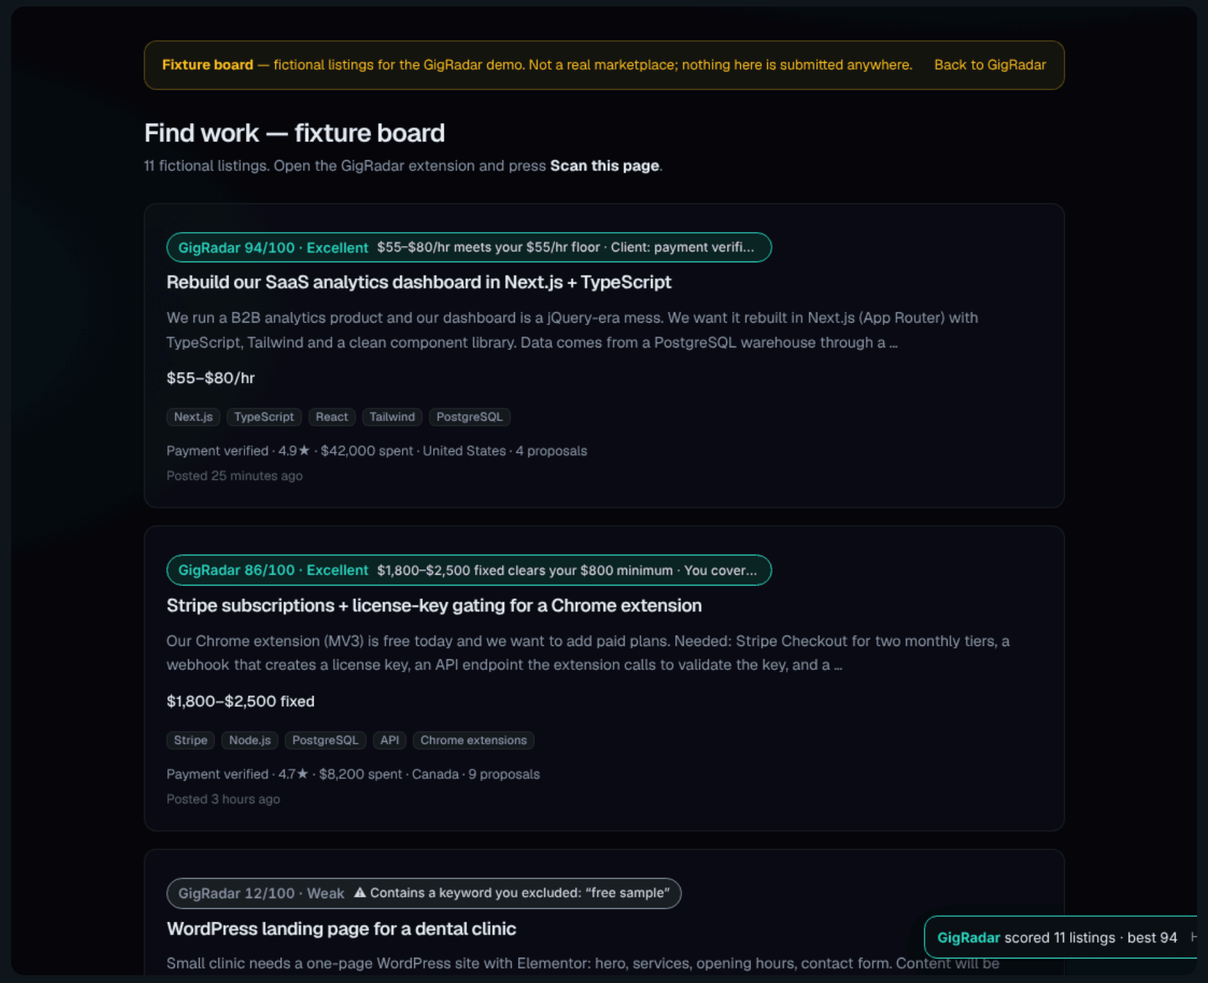

A daily email of the best matches, each with the checklist and a link to submit.

5 · You close

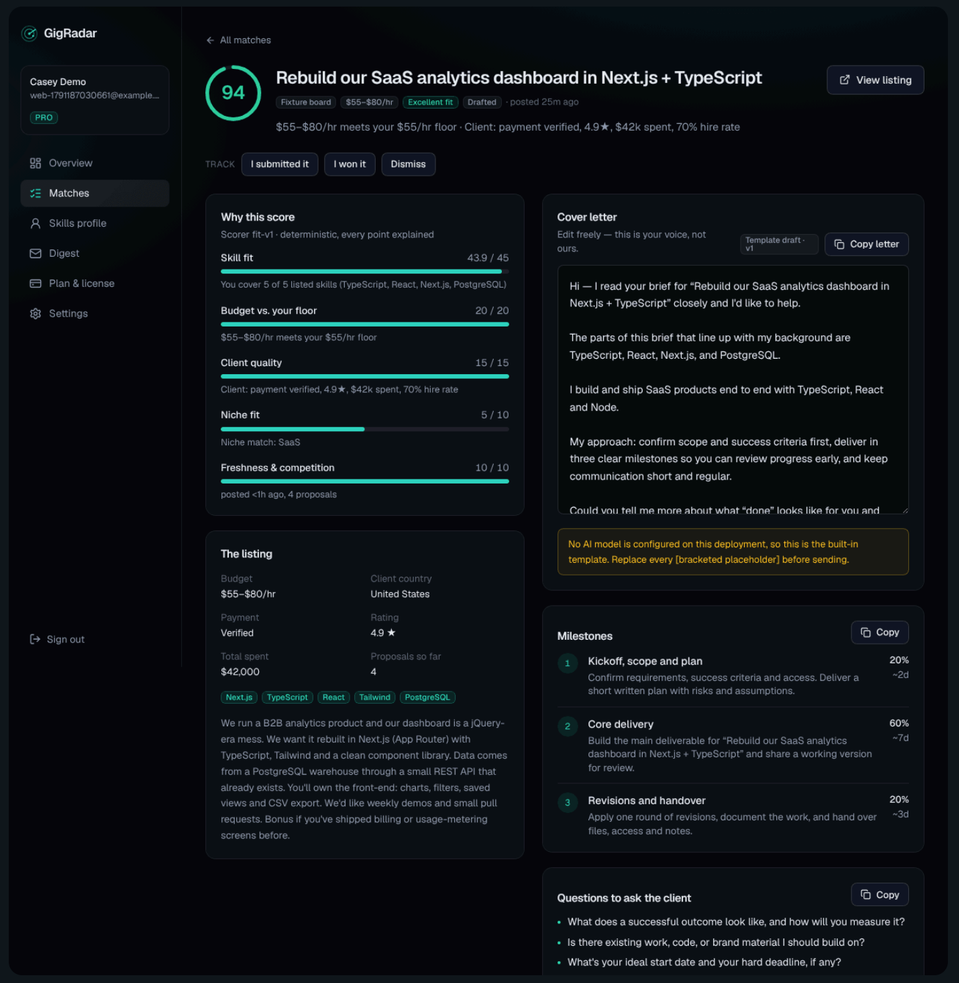

Read, edit, tick the checklist, and submit on the marketplace yourself.

> The extension reads only the page you have open, only when you ask. It can fill the proposal box. It never presses Submit, sends messages or bids.

In the product

In-page fit badges on the built-in fixture board (fictional listings)

Every point explained, plus the draft and the human checklist

Explainable scoring: `fit-v1`

FACTOR	MAX	LOOKS AT
Skill fit	**45**	Your skills vs. tags and text (alias-aware)
Budget vs. floor	**20**	Hourly or fixed budget vs. your minimum
Client quality	**15**	Payment verified, rating, spend, hire rate
Niche fit	**10**	Your niches in the listing
Freshness	**10**	Posting age and proposal count

Deterministic and model-free

No LLM call to score, so the Free tier costs almost nothing to serve.

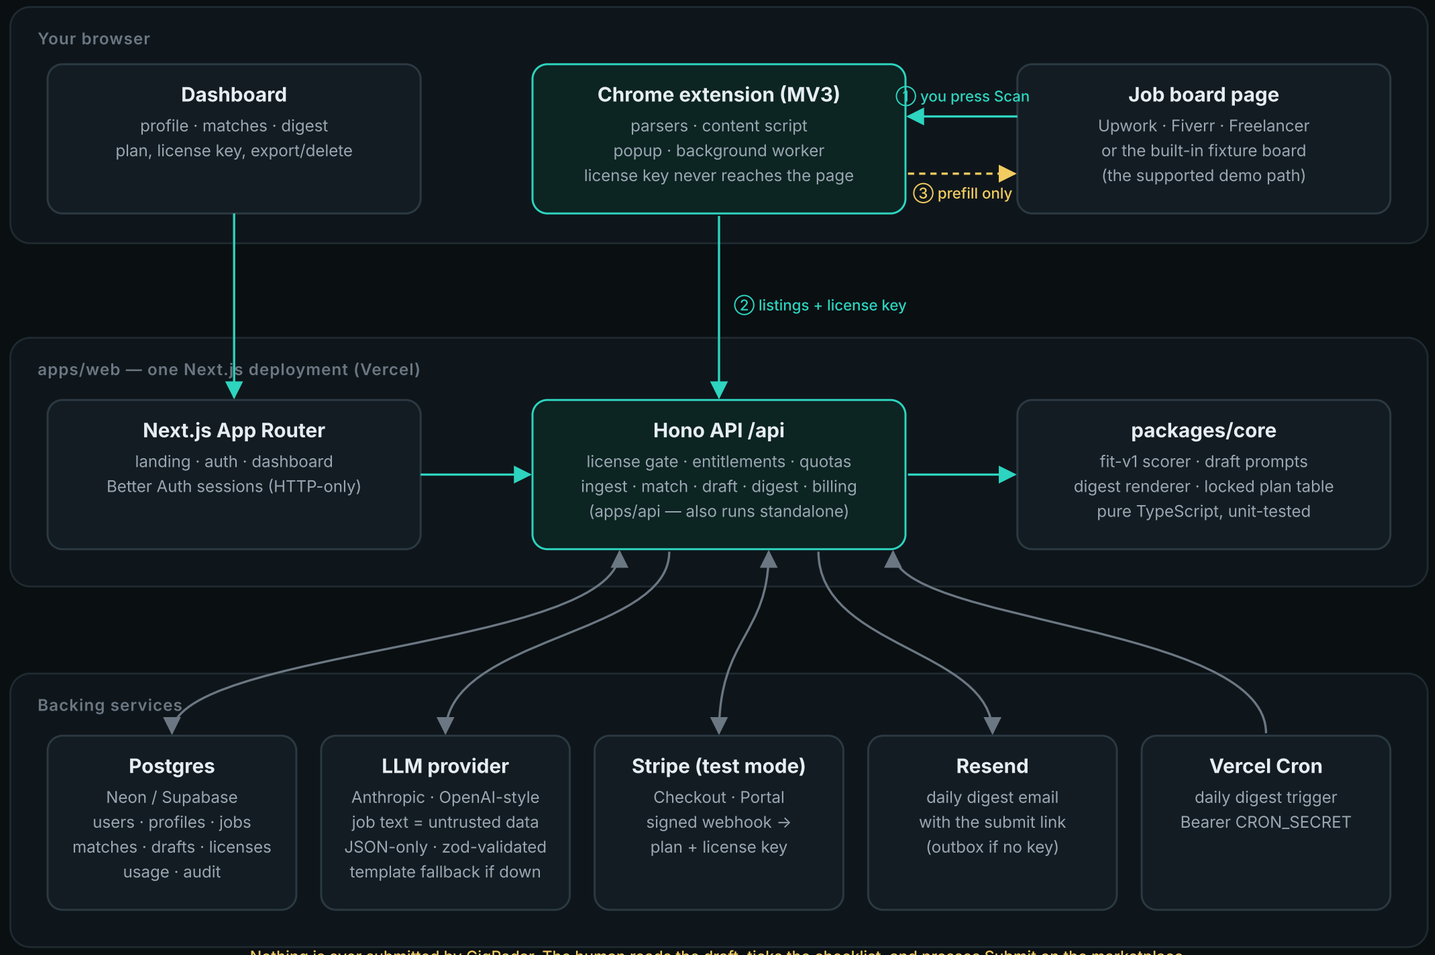

Unknown is not bad

A listing isn't penalised for facts the page didn't show. Missing client data scores neutral.

Excluded keywords cap the score

"Contains a keyword you excluded" shows on the badge.

Architecture

Nothing is ever submitted by GigRadar. The human reads the draft, ticks the checklist, and presses Submit on the marketplace.

TypeScript monorepo · Next.js 16 + Hono API at `/api` · Drizzle on Postgres (Neon) · Better Auth · Stripe Checkout + signed webhooks · Resend · Manifest V3 extension · 77 automated tests (37 API, 26 core, 14 extension)

Governance and safety, built in

Human in the loop

Scan on user action only. Auto-scan is opt-in and off by default. Prefill only, never submit. Every draft carries a mandatory checklist.

Listings are untrusted input

Listing text is fenced in prompts, output is JSON validated with zod, links limited to your portfolio, human steps injected after generation.

Honest drafts

Only facts from your profile. `[placeholders]` where it would otherwise invent experience. Template mode is labelled.

No credential capture

No marketplace logins, cookies or background crawling. Signed license keys, derived not stored, rotatable and revocable.

User data rights

One-click export and account delete (which also cancels the Stripe subscription).

Known gaps, written down

No email verification, 2FA or CSP yet. Marketplace parsers unverified. All listed in COMPLIANCE.md.

Pricing

Free

$0

- 5 scored matches / week
- Radar only
- Acquisition channel, cheap to serve

Pro

$29/mo

- Unlimited matching
- Proposal drafts
- Email digest
- 1 seat

Studio

$99/mo

- 5 seats
- Work-bench deliverable drafts
- Priority queue

> The paywall sits on what saves hours (drafts and digest), which is also where the variable cost is. Conversion path: Free user hits the weekly cap mid-session → Upgrade → Stripe Checkout → webhook issues a license key, flips the plan and scores the locked listings.

Unit economics

illustrative assumptions, not measurements

PER PRO USER / MONTH	EST.
Price	$29.00
Card processing (≈2.9% + 30¢)	−$1.14
Subscription billing fee (≈0.7%)	−$0.20
LLM drafts (assume 40 × ~$0.02)	−$0.80
Hosting, Postgres, email (assumed)	−$0.50
Contribution	**≈ $26.36 (≈ 91%)**

Cost control

Free users never trigger an LLM call. Drafts have a fair-use ceiling (one constant, `DRAFTS_PER_DAY`) to tighten once real cost per draft is measured.

Simple arithmetic

Every 1,000 Pro subscribers = $29k MRR. That is a scenario, not a forecast.

Status today

Stripe in **test mode**. No customers, no revenue yet.

> Fee rates are approximate published Stripe rates; check current pricing. First milestone after launch: instrument cost per draft and cost per active user.

Market context

$4.03B

Upwork gross services volume, FY2025, across **785k** active clients

3.1M

Fiverr annual active buyers at end of 2025, spending **$342** each on average

Billions flow through these marketplaces every year, and every dollar starts with a freelancer deciding which listing to answer and writing the proposal. GigRadar sells that time back to the freelancer.

> Sources: Upwork Q4 and FY2025 results (Feb 2026); Fiverr Q4 and FY2025 results. Figures describe the marketplaces, not GigRadar.

Honest scope, and what's next

True today

- Live on HTTPS with Postgres, Stripe test mode, license-gated API and extension
- Supported demo path: the built-in **fixture board** (11 fictional, labelled listings)
- Upwork, Fiverr and Freelancer parsers are best-effort and **unverified**
- Studio seats = 5 license keys on one account, not a full team model

Next

- Verified parsers, or official APIs and partnerships
- Email verification, 2FA, CSP
- Per-seat profiles and organisations for Studio
- Win/loss feedback to tune scoring weights
- Measured cost model: cost per draft, per active user

GigRadar

GigRadar finds the gigs that fit and drafts the pitch.
